

Differentiating Mathematics Instruction with Middle School Students: Findings in Progress

Amy Hackenberg
Robin Jones
Ayfer Eker
Mark Creager

This presentation is based upon work supported by the National Science Foundation under Grant No. DRL-1252575

Overview

- ◆ Describe IDR²eAM project
- ◆ Share features of DI we are experimenting with
- ◆ Give example of this experimentation
- ◆ Solicit feedback about our analytical process

The IDR²eAM Project

- ◆ Investigating Differentiated Instruction and Relationships between Rational Number Knowledge and Algebraic Reasoning in Middle School
- ◆ Research goals:
 - ◆ To investigate how to differentiate mathematics instruction for middle school students operating with at least two different levels of reasoning
 - ◆ To understand how students' rational number knowledge and algebraic reasoning are related for each of these mathematical thinkers.
 - ◆ In later years of the project we will also be investigating how classroom teachers learn to differentiate instruction.

Research Questions

- ◆ What are constraints in and affordances for differentiating mathematics instruction for middle school students?
- ◆ How does DI impact students and teachers, both cognitively and affectively?
- ◆ How do teachers develop understanding of and skill at differentiating mathematics instruction for middle school students at different levels of reasoning?

Project Timeline

- ◆ **Years 1-2:** Conduct design experiments with groups of nine 7th and 8th grade students with diverse cognitive characteristics.
 - ◆ We began retrospective analysis of Year 1 data in summer and fall 2014.
 - ◆ We are in our third, iterative experiment in spring 2015.
- ◆ **Year 3:** Form a study group with 10-15 middle school classroom teachers in Indiana to explore how to differentiate mathematics instruction in whole classrooms.
 - ◆ We will also continue retrospective analysis of Year 1-2 data.
- ◆ **Years 4-5:** Co-teach with classroom teachers in classroom design experiments to explore differentiated instruction in topics related to rational numbers and algebraic reasoning.

How do we define differentiated instruction?

- ◆ Proactively tailoring instruction to students' different learning needs, such as students' readiness and cognitive abilities, interests, and learning profiles and backgrounds (Tomlinson, 2005).
- ◆ We are focused on students' cognitive diversity; our definition/characterization of DI is under development.
- ◆ An alternative to...
 - ◆ Tracking
 - ◆ Individualized instruction for all
 - ◆ The same instruction for all
 - ◆ Labeling one way of thinking as “normal” and others as “advanced” or “slow” and making adjustments for those thinkers.

Why Differentiate?

- ◆ Student and Teacher needs
 - ◆ Students are in many different places in their understanding.
 - ◆ Teachers want to be able to communicate mathematically with a wider range of students
 - ◆ Students who are attempting to understand a variety of ways of thinking may improve classroom cohesion as well as mathematical power.
- ◆ Societal needs
 - ◆ US classrooms are increasingly diverse
 - ◆ Tracking often compounds existing inequalities
 - ◆ Undifferentiated classrooms serve few students well

Features of DI in Years 1-2

1. Formative assessment
 2. Mathematics problems with choices: e.g., Parallel Tasks
 3. Flexible and intentional small groups
 4. Student work in small groups
 5. Whole classroom discussion about a topic, across different problems
- ◆ **Important Note:** All of the above require developing clarity about Big Mathematical Ideas and Goals.

Example of Experimentation

Small group work, fall 2013

The screenshot displays the JavaBars software interface. The title bar reads "Bars5_0" and "JavaBars". The menu bar includes "Bar", "Cover", "Mat", "Erase", "Copy", "Join", "Cut", "Fill", "Repeat", "Label", "Group", "Ungroup", "Set Unit Bar", and "Measure". Below the menu bar are two sets of controls: "Parts" and "Pieces". The "Parts" section has buttons for "Up/Down", "Left/Right", "Parts", "Break", "Clear", "Combine", "Bar", "Fill", and "Pullout". The "Pieces" section has buttons for "Up/Down", "Left/Right", "Pieces", "Break", "Clear", "Combine", "Bar", "Fill", and "Pullout". At the bottom of the interface are buttons for "New", "Save", "Load", "Undo", "Print", and "Configure".

The workspace contains several elements:

- A red bar labeled "1 tbsp" at the top left.
- A blue bar labeled "1 ounce" below it.
- Three red bars arranged horizontally.
- A large cyan bar composed of many small segments.
- A red bar labeled "1 tbsp" below the cyan bar.
- A cyan bar labeled "5 1/3 oz" below the red bar.
- Two red bars labeled "5 1/3 oz" at the bottom.

In the bottom right corner, there is a small video inset showing a person sitting at a desk with papers, looking towards the camera.

Group roles, spring 2014

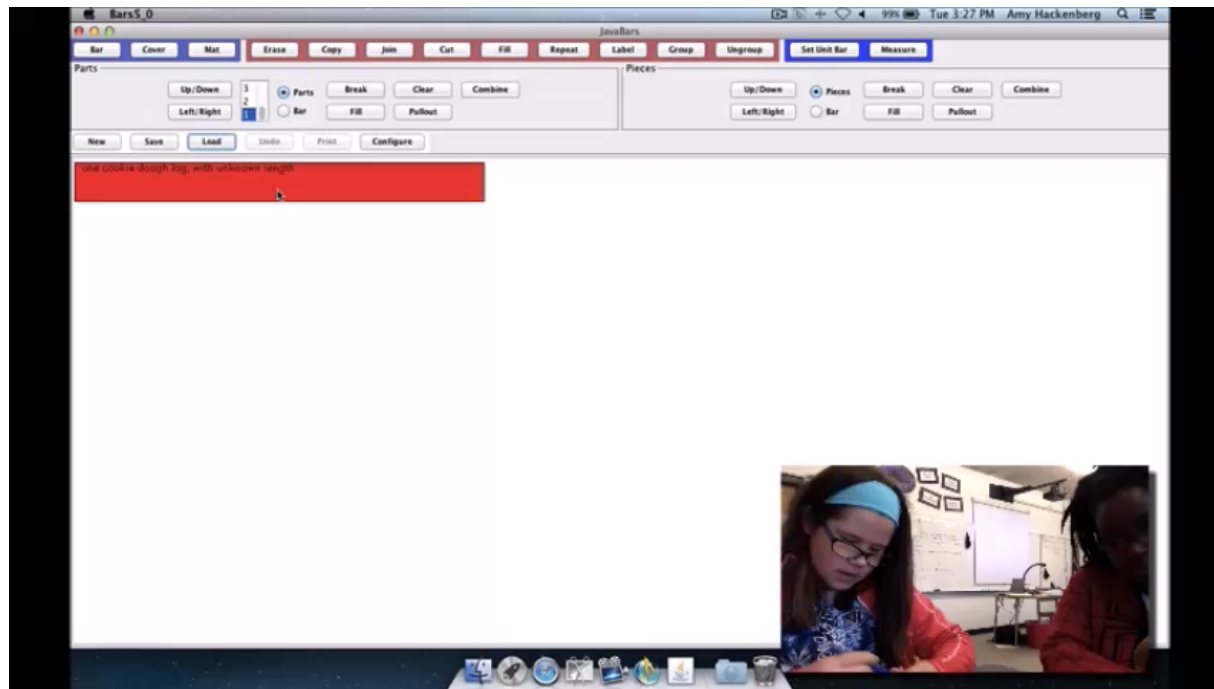

Facilitator	Recorder/Reporter	Questioner
<p>*Keeps group organized, focused, and together. *Makes sure everyone's voice is heard. *Keeps track of time.</p> <p>***Sounds like? “We haven't heard from Alex yet. What do you think of our idea, Alex?”</p>	<p>*Calls over an adult only for group questions. *Makes sure everyone has time on the computer. *Makes sure that all ideas get recorded on paper/computer.</p> <p>***Sounds like? “Are we all stuck on #3? No ideas? OK, I'll ask Ms. H to come over.”</p>	<p>*Makes sure everyone understands the task. *Asks questions to clarify ideas and consider alternatives. *Helps find compromises and settle disputes.</p> <p>***Sounds like? “How about we listen to Alex's idea first, and then we'll get to Susan's.”</p>

Group work check-ins, spring 2014

OVERHEARD/SEEN LAST TIME (3/11/14)

- “Is that kind of like what you guys were talking about?”
[Group member show JavaBars picture to others in group.]
- ~~Group member tries to read the problem aloud to the group and other group members talk to each other.~~
- One group member asks another: “Why do you think that?”
- ~~Two group members “fight” over who gets the mouse.~~
- One group member starts to make a JavaBars picture right away and stays focused on drawing it.
- Ms. H. asks: “Do you agree with what she said?” “Yes,” says another group member, “but actually I wasn’t listening. Can you say it again?”

Small group work, spring 2014

Retrospective Analysis

- ◆ During the summer and fall after Year 1 we spent time on analysis. We have two strands of analysis underway:
 - ◆ Student thinking
 - ◆ The functioning of differentiated instruction

Our Coding Process

- ◆ Initially: Open coding by hand, beginning with a whole-class discussion
- ◆ Open coding using ATLAS.ti (about 2 months)
- ◆ Our assessment of initial coding:
 - ◆ Captured student thinking well
 - ◆ Captured aspects of teacher-student interactions
 - ◆ Did not seem to capture student-student interactions, which appear to be a vital aspect of DI

Student-student interactions, spring 2015

- ◆ Student-to-student interaction is key
 - ◆ Teachers need to help create structure for interaction
 - ◆ Explicit instruction in how to respond to others may be necessary
- ◆ Cognitive diversity requires a different sense of 'productivity'
 - ◆ With support, students can try to make sense of others' ways of thinking without being overwhelmed

Seeking Advice

- ◆ Can we structure analysis to capture student-student interaction (whole-class and small group)?
 - ◆ Navigating issues of open coding vs. structuring coding to capture particular aspects of a class
- ◆ How can we code productively with groups (ATLAS.ti)?
