Please take a couple minutes to work on the “Crate Problem” and “Partial Crate Problem” on your handout.

If you have time before we start, discuss it with those around you and consider how middle school students might explain their work on this task.
TIERED INSTRUCTION: ONE STRATEGY FOR DIFFERENTIATION IN MIDDLE SCHOOL

This presentation is based upon work supported by the National Science Foundation under Grant No. DRL-1252575
Who We Are

Patti Walsh
Teacher, Tri-North Middle School, Bloomington, IN

Rebecca Borowski
Former elementary school teacher (11 years)
Doctoral Student, IU Bloomington

Amy Hackenberg
Former middle & high school teacher (9 years)
Associate Professor, IU Bloomington
OUR GOAL TODAY

- Share lessons learned from a teacher-researcher partnership to study differentiating instruction in middle school math classes.

The IDR²eAM project: Investigating Differentiated Instruction and Relationships between Rational Number Knowledge and Algebraic Reasoning in Middle School.

DEFINITION: proactively tailoring instruction to students’ mathematical thinking while aiming to develop a cohesive classroom community (Tomlinson, 2005)

TEACHING PRACTICES:
- (1) using research-based knowledge of students’ mathematical thinking
- (2) providing purposeful choices and different pathways
- (3) inquiring responsively during group work
- (4) attending to small group functioning
- (5) conducting whole classroom discussions across different thinkers

(1) and (3) are about the heart of differentiating:
GETTING TO KNOW STUDENTS’ THINKING
**SOME PRACTICES FOR DIFFERENTIATING**

**Providing Purposeful Choices**
- **Choice Problems (Land, 2017)**
  - same problem with number choices
  - students choose numbers that are a good level of challenge for them
- **Parallel Tasks (Small & Lin, 2010)**
  - same big idea, 2-3 problems
  - students choose problem

**Designing Different Pathways**
- **Tiering Instruction** –
  - same big idea
  - different sequences of problems
  - teacher designs/chooses based on formative assessment

**Inquiring Responsively in Groups**
- listen, observe, ask questions
- try to understand how students are understanding problems
- pose questions, adaptations of problems, follow-up problems
a unit of eight units each containing three units

## UNITS COORDINATION – 3 STAGES

<table>
<thead>
<tr>
<th>Stage</th>
<th>Students’ unit structures</th>
<th>Students’ reasoning on the crate task</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stage 1</td>
<td>Students can take one level of units as given, and may coordinate two levels of units in activity.</td>
<td>Often must “build up from ones” to nest quantities, and cannot keep multiple levels in mind when operating further.</td>
</tr>
<tr>
<td>Stage 2</td>
<td>Students can take two levels of units as given, and may coordinate three levels of units in activity.</td>
<td>They can iterate composite units, so a package can be both a package and 4 cans even as they’re building up 8 of them into a box. Sometimes conflate boxes and packages when working with a crate.</td>
</tr>
<tr>
<td>Stage 3</td>
<td>Students can take three levels of units as given, and thus flexibly switch between three-level structures.</td>
<td>They can usually move flexibly among packages, boxes and crate without conflation.</td>
</tr>
</tbody>
</table>
**UNIT COORDINATION - ALYSSA**

| Stage 1 | Students can take one level of units as given, and may coordinate two levels of units in activity. | Often must “build up from ones” to nest quantities, and cannot keep multiple levels in mind when operating further. |

![Diagram of units coordination process](image)
| Stage 2 | Students can take two levels of units as given, and may coordinate three levels of units in activity. | They can iterate composite units, so a package can be both a package and 4 cans even as they’re building up 8 of them into a box. Sometimes conflate boxes and packages when working with a crate. |
UNITS COORDINATION – JOANNA
### Stage 3

Students can take three levels of units as given, and thus flexibly switch between three-level structures.

They can usually move flexibly among packages, boxes and crate without conflation.
Comparing and Scaling unit from the Connected Mathematics Project (CMP 3):
- Ratios and proportional reasoning
- 18 regular 7\textsuperscript{th} grade mathematics students (plus 2 not participating)
  - 5 stage 1, 9 stage 2, 4 stage 3
- 26 days
- 3 investigations

Where did differentiating happen?

- **Before the lessons (and between lessons)**
  - Lesson Planning
  - Task Selection
  - Plan, Plan, Plan
  - Remediation/Enrichment

- **During the lessons**
  - Questioning
  - Class Discussion
  - Be a Kid-Watcher

- **What continued after the unit was over?**
  - Teacher-selected numbers for the same problem
  - Intentional question planning/Differentiated questioning during class
  - Choice activities
Why co-teach together rather than observe?
- Need to be part of the interaction (teaching as a method to investigate learning)
- Need to have multiple people learning together

What made Comparing and Scaling a good unit for differentiation?
- Multiplicative reasoning
- Inquiry-based

What did you learn about differentiation in running this experiment?
- All stages of thinkers present in regular 7th grade classes (and 8th!)
- Providing choices and different pathways can benefit student learning
- How helpful it was to start from research-based knowledge, as we did with this unit
DEFINITION: designing different problems (or sequences of problems) for different groups of students based on conjectures about what will support students’ learning needs (Tomlinson, 2005).

Usually follows providing students with choices or getting to know student thinking in some way, such as through responsive inquiry.
RACES APP

Try It out!

- Make the red car go slower when both cars travel the same distance.
- Make the red car go slower when both cars travel for the same amount of time.
- Make the cars travel the same speed when they travel different distances/times.

www.geogebra.org: Search Janet Bowers Races
Direct link: https://www.geogebra.org/m/J434Kb54
How do you measure fastness? How do you tell one car is faster?

Make the red car go slower if:
- Both travel the same distance
- Both travel for the same time.
- Write a general rule for how to make this happen.

Making the red car go slower when distance values were the same was not problematic.
Making the red car go slower when time values were the same was harder for some students.
MAKING CARS GO THE SAME SPEED

- Days 12 & 13
- Blue car goes ___ miles in ___ minutes. Make the red car go the same speed.
  - Draw a picture to explain/justify

Tiering plan

MAKING CARS GO THE SAME SPEED: SARA & LISA
15 MILES IN 6 MIN
MAKING CARS GO THE SAME SPEED: SARA & LISA
15 MILES IN 6 MIN
LISA’S PICTURES
15 MILES IN 6 MIN
JOANNA’S GROUP
15 MILES IN 9 MIN
JOANNA’S PICTURE
15 MILES IN 9 MIN

The two cars are going at the same speed?

\[ \frac{1}{3} \text{ of Trip} \quad \frac{2}{3} \text{ of Trip} - 10 \text{ mins} \]

\[ 5 \text{ mins} \]

0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15

15 miles
Both groups solved their problem. What were their ways of thinking and how were they different?

- Joanna:
  - Multiples of the least common factors of the given values would produce the same speed.
  - She knew this was general and could produce many same speed pairs. She never considers doubling, but that is included in her general solution.

- Sara and Lisa:
  - Doubling (and then tripling, quadrupling) was a process that became general for them on Day 12 (not right away).
  - But they did not create smaller distance-time pairs until prompted, and then they only halved. No thirding observed from them or other stage 2 students.

What was similar about their thinking?
- Neither fully articulated how their pictures showed that the distance-time pairs yielded the same speeds (on Day 13). They both came close.

Were the numbers choices good for them?
- Joanna: Yes.
- Sara and Lisa: Yes, but.
...RELATIONSHIPS TO STAGES...

- Joanna:

- Sara and Lisa:
What’s a topic you will be working on soon with your students?

How could tiering fit with this topic?

If you are not sure about tiering, what about making choice problems?
  - What are your rationales for different number choices?

What resources do you use for finding tasks?
  - We used CMP and Joanne Lobato’s project, mathtalk.sdsu.edu.

EMILY – DEVELOPING A PICTURE
EMILY'S PICTURES
Based on your table, tell how can you tell if the two cars are going at the same speed?

You would have to multiply the speed x2. One x8 just going farther than the other.

\[
\begin{align*}
\frac{6}{12} \times \frac{15}{30} & = 1 \times 1 \\
\frac{18}{45} & = \frac{2}{2} \\
\frac{18}{36} \times \frac{9}{18} & = 1 \times 1 \\
\frac{18}{180} & = \frac{1}{10}
\end{align*}
\]
